(SENT) see AA110068 AA1284 9) The present sequence is a peptide encoded by one such probe. The SENUs are derived from human Hela cells. The SENUs can be used to produce a single exon microarray, which can be used for measuring human qene expression in a sample derived from human erivinal epithelial cells. By measuring one expression, the probes are therefore useful in grading and/or staging of diseases of the cervix, notably
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WiPo at Ltp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present invention relates to boman single exon nucleic acid probes
                              Peptide #1396 encoded by probe for measuring cervical gene expression
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      edpe (a)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present invention relates to single exon nucleic acid probes for measuring human gone expression in a sample derived from human heart (see AHASISS ABAHI30S). The present sequence is a protein encoded by one such probe. The probes may be used for predicting, measuring and displaying gene expression in samples derived from the human heart via microarrays.
                                                                                                                                                                                                                                                                                                                                                                                                    Protein #1373 encoded by probe for measuring heart cell gene expression.
                                                    The invention relates to a single exon nucleic acid probe for measuring human gene expression in a sample derived from human foetal liver. The single exon nucleic acid probes may be used for predicting, measuring and displaying gene expression in samples derived from human fetal liver. The present sequence is a peptide encoded by a single exon nucleic acid probe of the invention.

Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Single exon nucleic acid probes for analyzing yene expression in human
                                                                                                                                                                                                                                Gaps
Human genome-derived single exon nucleic acid probes useful for
analyzing gene expression in human fetal liver -
                                                                                                                                                                                                                              o,

They can be used to measure gone expression in brain cell samples, which may enable the diagnosis and improved treatment of nervous system diseases such as Alzheimer's disease, multiple sclerosis, schizophrenia, pillepsy and cancers. The present sequence is a protein encoded by one of the probes of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Human brain expressed single exon probe enceded protein SPQ 10 NO: 26806.
By measuring gene expression, the probes are useful for predicting, diagnosing, grading, staging, monitoring and proquosing diseases of the human heart and vascular system e.g. cardiovascular disease, hyperteision, aradian arrhythmias and rengenital heart disease. Note: The sequence data for this patcht did not form part of the printed specification, but was obtained in electronic formal directly from WIPO at fib.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Single exon nucleic acid probes for analyzing gene expression in human

the invention relates to isolated polynucleotide (i) and polynetide (II) sequences. (I) is useful as hybridisation probes, polymentase chain reaction (PCR) primers, obligances, and for edromosome and gene mapping, and in recombinant production of III. The polynucleotides are also used in diagnostics as expressed sequence tags for identifying expressed enters. (I) is useful in gene therapy techniques to restore normal activity of (II) or to treat disease states involving (II). (II) is useful to generating antibodies adainst it detecting or quantitating a polypotide in tissue, as molecular weight markers and as a tood supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful in medical imaging alerrant profesion or biological activity.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Ċ
                                                                                                                                                                                                                                                                                                 The polypeptide and polynacieotide Sequences have applications in diagnostics, forensies, gene mapping, identification of mutations responsible for genetic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and amino acid sequences. ABG00010-ABG30377 represent novel human diagnostic amino acid sequences of the invention.

Note: The sequence data for this patent did not appear in the printed specification, but was obtained in electronic format directly from WIPO
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Peptide #1402 encoded by breast cell single exon nucleic acid probe.

agents on cells, the microarray of this invention prosents a far areater diversity of probes for measuring gene expression, with far less bias than expressed sequence tag microarrays. The method is suitable for rapid production of functional information trum genomic sequence. The present sequence is a peptide encoded by a single exon nucleic acid
                                                                                                                                    nucleic acid probes for measuring gene expression in a sample derived from human breast and BT 474 cells. The method involves contacting the probes with a collection of detectably labelled involves contacting derived from miRNA of human breast, and then measuring the label bound to each probe of the microatray. The probes are useful for verifying the expression of regions of genomic bNA predicted to encode proteins. They are useful for quene discovery, and for determining predisposition and/or prognosing breast disease, Gene expression analysis is useful for assessing the toxicity of chemical
                                                                                                                                                                                                                                                                                                                                                                                                   protect The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WiPO at ftp.wipo.int/pub/published_pet_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Human; foctal liver; gene expression, single exon nucleic acid probe

The peptides, nucleotides, antibodies, adopted an adjoint and antegorists may be also be used in drug serects. AAC78449 to AAC78457 and AAB44240 represent sequences used in the exemplification of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Polynuciectides, polypeptides, antibodies, agonists and untagonists from
the present invention may be used to treat immune disorders by activating
or inhibiting the proliferation, differentiation or mobilisation of
immune cells, to treat disorders of harmanopoletic cells, autoimmune
disorders, allergic reactions, graft versus host disease and organ
rejection, modulate harmanostatic or thrombolytic activity, modulate
                                                                                                                                                                                                                                                                                                                                            include: cytostatic; profilerative, vulnerary; immincumodulator; antidatebucte, antidathumatic, antifheumatic, antifheumatic, antidathumatory, antithyroid, antidicyjic; antiboterial; antivital, dermatological, neuroprotective, cardiant, thrombolytic; coagulant; neuropropic; antiporropic; antiporropic; antiporropic; antiporropic; antiporropic; antiporropic antidatic and antiangloganic. The polynocleotides and polypeptides can be used for preventing, treating or ameliorating medical conditions and diagnosing pathological conditions.
                                                                                                                                                                                                                                                                              in AAB43398 to AAB44239. The proteins can have activities based on the Lissues and cells the genes are expressed in. Example of activities
                                                                                                                                                                                                                                         AAC77607 to AAC78448 encode the human cancer associated proteins given
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps

The invention relates to isolated polynucleotide (1) and polypeptide (i1) sequences. (1) is useful as hybridisation probes, polymerase chain reaction (PTP) primers, chicamers, and for chromosome and gene mapping, and in recombinant production of (II). The polynucleotides are also used in diagnostics as expressed sequence tags for identifying expressed genes. (1) is useful in your thorapy techniques to restore normal activity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it detecting or quantifating a polypeptide in tissue, as molecular weight markers and as a food supplement (II) and its binding partners are useful in medical
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  inaging of sites expressing (II). (I) and (II) are useful for treating disorders involving observat protein, expression, or biological activity. The polypeptide and polyuchectide sequences have applications in diagnostics, forensies, gene mapping, identification of muchtions responsible for genetic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and amino acid sequences. And 000 (0.5MS 3037 represent novel human Nete: The sequences And of this patent did so appear in the printed specification, but was obtained is electronic format directly from With II print int/pub/published_pcl_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Sdef

```
proteins or their active domains. The polypeptides, polyburied ides and antibodies raised against the polypeptides are used in a method of treatment of a mammal and prevention of disorders caused by the aberrant protein expression or activity. The polypeptides can be used as molecular weight markers, food supplements, and in antibody production, the polypeptides are used to identify compounds which bind to the polypeptides. Polynucleides to the invention are used as probes and primers, for sequencing, for chromosome or gene mapping, in the production of recombinant proteins, and in generating anti sense DNA or target dids; to a tumour, in assays to determine biological activity, to raise antibodies/elicit an immune response, to determine quantitative
                                                                                                                                                                                                                                                                                                                                                                                                                                     sclerosis, stroke, immune deficiencies resulting from bacterial, viral or
fungal infection of from autoimmunity, cancer, allergy, asthma,
                                                                                                                                                                                                                                                                        protein levels, as tissue markers, and to isolate receptors or liquids. Oblygeptides of the invention may also be useful in treating platelet disorders, regenerating bone, cartilage, fendon, ligament and/or nerve tissue, wound healing, treating burns, promoting the proliforation, differentiation and survival of stem cells, as a contraceptive, treating osteoporosis and osteoarthis, andemia. Altheimer's, Parkinson's and inntington's diseases, amylotrophic lateral

                                                                                                                                                                                         The invention relates to isolated polynuclectide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PTP) primers, oilgomers, and for chromosome and gene mapping, and in recombinant production of (II). The polynucleotides are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques to restore normal activity of (II) or to treat disease states involving (II). II is useful for generaling antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as
                                                                                                                                                                                                                                                                                                                                                                  a food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful for treating disorders involving abernant protein expression or bin majoral activity. The polypetide and polynucleotide sequences have applications in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits to assess biodiversity
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  and to produce other types of data and products dependent on DNA and amino acid sequences. ABC00010-ABG30377 represent novel human diagnostic amino acid sequences of the invention or the sequence data for this patent did not appear in the printed specification, but was obtained in electronic format directly from WIPO

for identifying expressed genes. (1) is useful in gene therapy techniques to restore normal attivity of (11) or to treat disease states involving quantitating a polypoptide in tissue, as molecular weight markers and as a food supplement. (11) and its binding partners are useful in medical adsorders involving aberraan protein or itself in restored in the polypoptide and protein expressing or involving aberraan protein expressing or highly for treating dissorders involving aberraan protein expression or highly including the polypoptide and polynucleotide sequences have applications in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and amino acid sequences Abstrantion represent movel human diagnostic amino acid sequences of the invention.

Note: The sequence data for this patent did incl appear in the printed specification, but was obtained in electronic format directly from WIPO
                                                                                                                                                                                                                                                                                     polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PCR) primers, oliquments, and for chromosome and gene mapping, and in recombinant production of (II). The polymorlectides are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy technique
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           o; Caps
                                                                                                                     New isolated polynucleotide and encoded polypeptides, useful in diagnostics, forensics, gene mapping, identification of mulations responsible for genetic disorders or other traits and to assess
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Forterre P, Thierry JC, Prieur D, Dietrich J, Lecompte O;

The invention is directed to BAP28 polymeptides, BAP28 polymoleotide sequences and regulatory region located at the 3' and 5' ends of the BAP28 colding region. He BAP28 polymoleotides can be expressed by standard recombinant methodology BAP28 polymoleotides and polymeptides have been found to be over expressed in prostate tumenr cells, therefore levels of BAP28 expression and/or activity may be assayed (e.g. by polymerase chain reaction (PCR)) to diagnose patient suttering from or susceptible to useful as diagnosite reagents. Biallelic markers of the BAP28 per are useful as diagnostic reagents. Biallelic markers of the BAP28 per are useful any genetic analysis. The present sequence represents a protein enroded by a first cDMA sequence of the BAP28 gone consisting of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New MARZB polynucleotides and polypeptides overexpressed in prostate cancer cells for diagnosing prostate tumors, e.g. by hybridization or

The sequence is that of a protein which can be used in the preparation of the recombinant breast cancer antigen, HRCA1, binding preparation of the recombinant breast cancer antigen, HRCA1, binding epictucins BARD1, Bi23, BE2, BE14, BE33 or BE445, or a composition for the detection of a BARD1, Bi23, BE2, BE31 or BE445 nucleic acid sequence, specifically a wild type BARD1 composition for the detection or purification of BARD1, and the detection and purification of a HRCA1 cancer BARD1 antibody, and in the detection and purification of a HRCA1 antiBARD1, BI23, BE2, BE14, BE31 or BE445 can be used in the detection and complex that alters the binding of BARD1, BI23, BE2, BE14, BE31 or BE445 to BRCA1 or the binding of BARD1, B123, BE2, BE14, BE31 or BE45, BE31 or BE45, BE31 or BE45, BE31 or BE45, a specific anti-BARD1 antibody can be used to identify a patient having or at risk of developing cancer.
